

## Linear and Binary Search

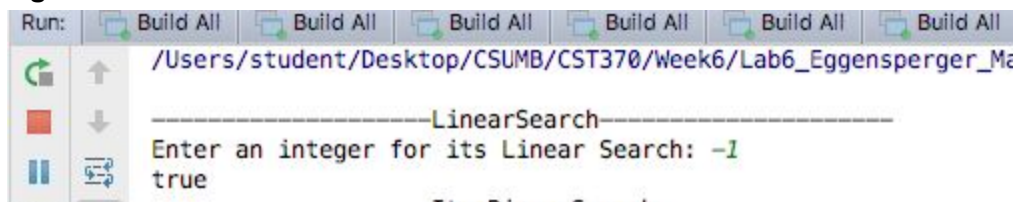

Objective: After completion of this lab, you will be able to write binary search algorithm in C++.  
Lab Exercise

Assume that you have an array of numbers sorted in ascending order.

**(a) Write a function called `LinearSearch()` which searches the function linearly and determines if a particular element is in the array. The function returns true if the element is in the array, otherwise it returns false. Call the `LinearSearch()` function from the main.**

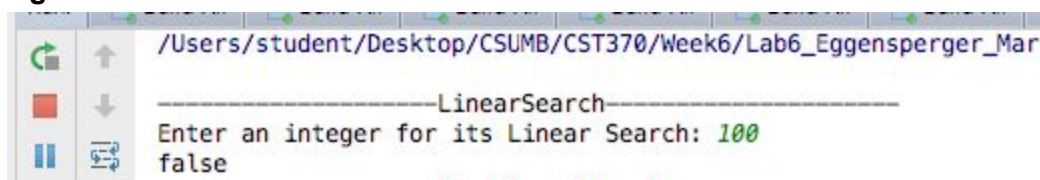

Given a method called, `bool LinearSearch(int A[], int size_of_A, int search_key_A)`, which searches a function linearly and determines if a particular element is in the array; the function returns true if an element is present in a given array or otherwise it returns false. Thus, give the array, `int A[] = { -1, 2, 3, 4, 6, 8, 9, 10, 11 }`, we get two valid outcomes.

**Figure 1** For true

```
Run: Build All Build All Build All Build All Build All Build All
/Users/student/Desktop/CSUMB/CST370/Week6/Lab6_Eggersperger_Ma
-----LinearSearch-----
Enter an integer for its Linear Search: -1
true
```

**Figure 2** For false

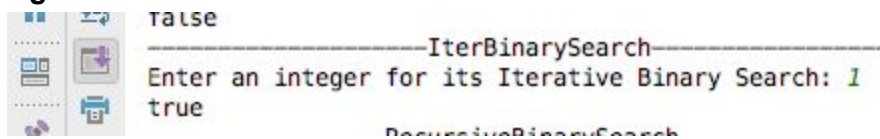

```
Run: Build All Build All Build All Build All Build All Build All
/Users/student/Desktop/CSUMB/CST370/Week6/Lab6_Eggersperger_Ma
-----LinearSearch-----
Enter an integer for its Linear Search: 100
false
```

(b) Write a function called `IterBinarySearch()` which iteratively performs a binary search and determines if a particular element is in the array. The function returns true if the element is in the array, otherwise it returns false. Call the `IterBinarySearch()` function from the main.

Given a method called, `bool IterBinarySearch(int B[], int size_of_B, int search_key_B)` which iteratively performs a binary search and determines if a particular element is in the array; the function therefore, returns true if the element is in the array; otherwise, it returns false. Thus given the array, `int B[] = { -11, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 }` we get two valid outcomes.

**Figure 1** for true

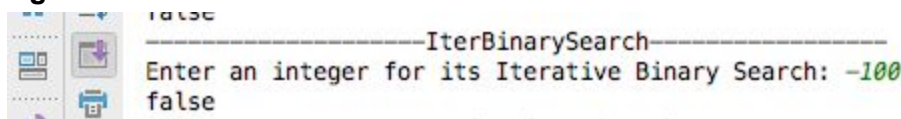

```

false
-----IterBinarySearch-----
Enter an integer for its Iterative Binary Search: 1
true
RecursiveBinarySearch

```

**Figure 2** for false

```

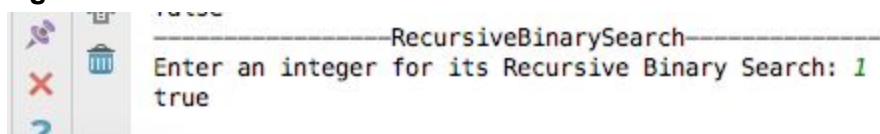

false
-----IterBinarySearch-----
Enter an integer for its Iterative Binary Search: -100
false
RecursiveBinarySearch

```

(c) Write a function called `RecursiveBinarySearch()` which recursively performs a binary search and determines if a particular element is in the array. The function returns true if the element is in the array, otherwise it returns false. Call the `RecursiveBinarySearch()` function from the main.

Given a method called, `bool RecursiveBinarySearch(int C[], int low, int high, int search_key_C)` which recursively performs a binary search and determines if a particular element is in the array. The function returns a true if the element is in the array; otherwise, the function returns false. Thus, given an array, `int C[] = { -20, 1, 2, 3, 4, 5, 6 }` we get two outcomes.

**Figure 1** for true

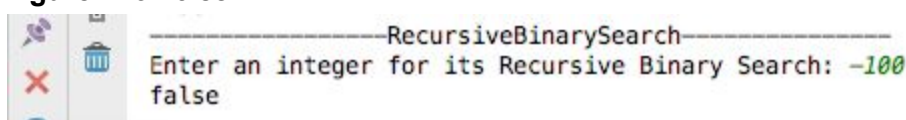

```

false
-----RecursiveBinarySearch-----
Enter an integer for its Recursive Binary Search: 1
true
RecursiveBinarySearch

```

**Figure 2** for false

```

false
-----RecursiveBinarySearch-----
Enter an integer for its Recursive Binary Search: -100
false
RecursiveBinarySearch

```
